

Multilevel Inheritance in Java

In Java, Multilevel Inheritance means a class inherits from a class that itself inherits from another class. It's like a chain.

```
// Base class
class Vehicle {
    public void move() {
        System.out.println("Vehicle is moving...");
    }
}

// Intermediate class that inherits from Vehicle
class Car extends Vehicle {
    public void playMusic() {
        System.out.println("Playing music in the car...");
    }
}

// Final class that inherits from Car (and indirectly from Vehicle)
class ElectricCar extends Car {
    public void chargeBattery() {
        System.out.println("Charging the electric car...");
    }
}

// Main class to run the program
public class Main {
    public static void main(String[] args) {
        ElectricCar myEV = new ElectricCar();

        // Calling method from Vehicle (grandparent)
        myEV.move();

        // Calling method from Car (parent)
        myEV.playMusic();

        // Calling method from ElectricCar (self)
        myEV.chargeBattery();
    }
}
```
